

Wild Pig Impacts in Pecan Operations

Charles Rohla
Stephen Webb

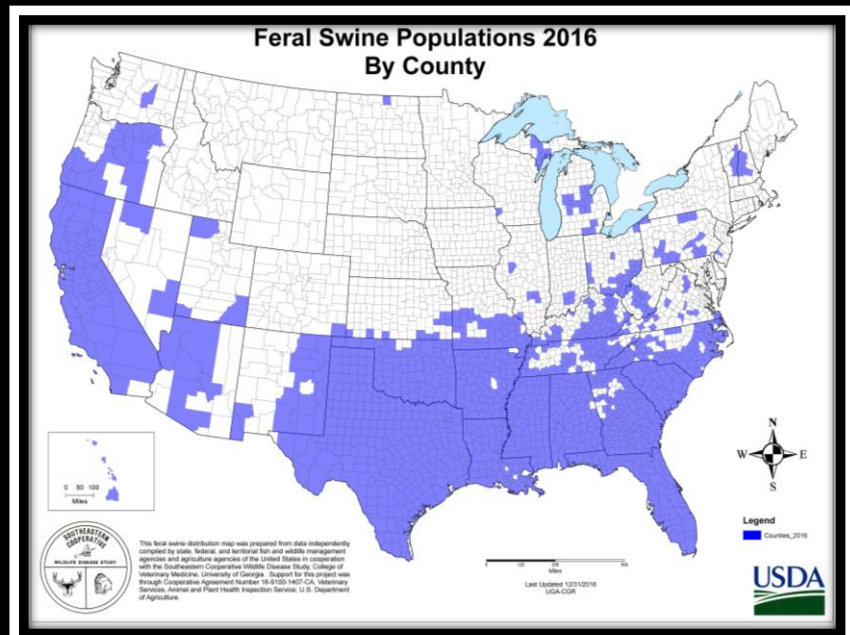

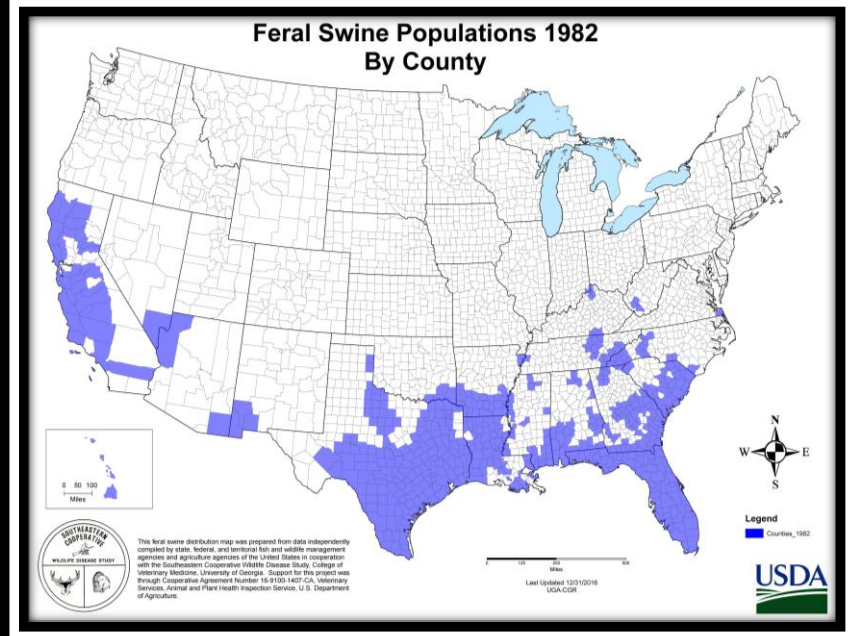

Kelly Boyer, Oklahoma State University

Wild Pigs:

Where did they come from?

- Early European settlers as a food source in the 1500's
- Sportsmen in the 1930's
- Populations have converged and have continued to grow

Life History of Wild Pigs

- Not a Native Species
- Wild pigs are opportunistic omnivores
- Highly adaptable to varying environments
- Extremely high reproductive rates
- Have no natural predators

The Problem

- **D**amage
- **D**epredation
- **D**isease
- **D**isturbance

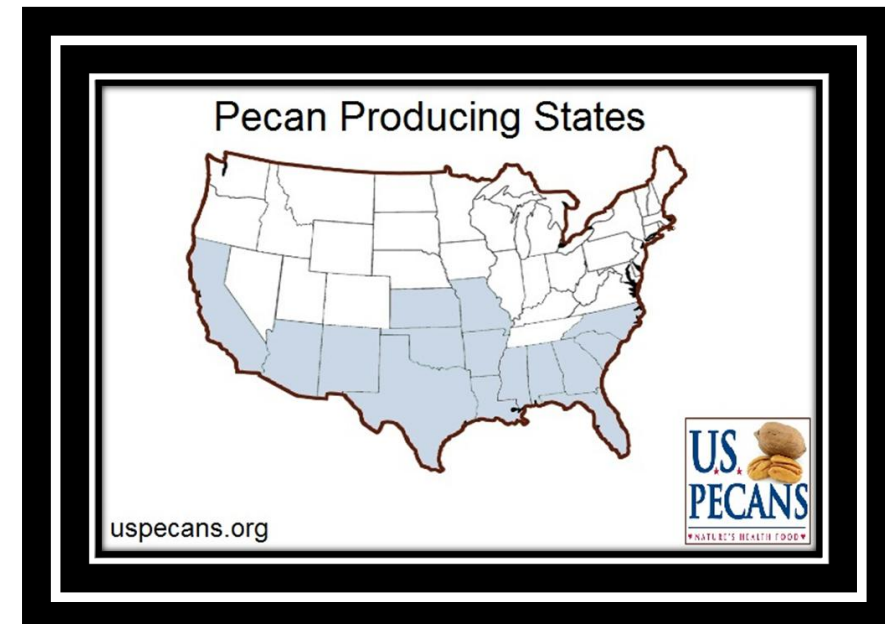

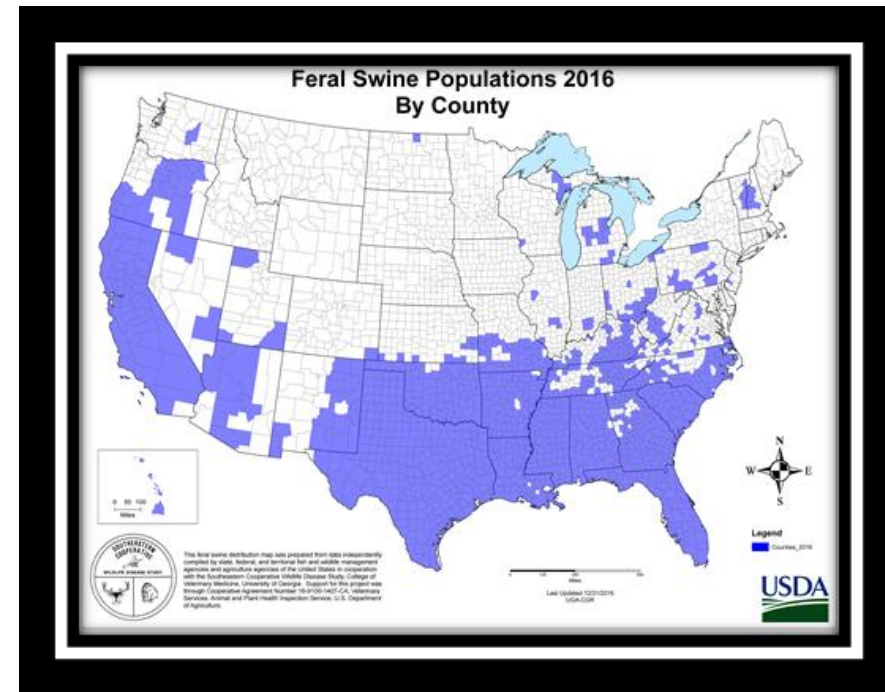

Why are they a problem?

- General foraging behavior such as rooting, digging and wallowing causes damage to pasture land, livestock, lawns and agricultural crops
- USDA has reported a conservative estimate \$2.5 Billion in damage and control directly attributed to wild pigs
 - With \$1.5 billion in agricultural loss alone in 2016

Wild Pigs : Pecans

- Pecan orchards and groves are attractive resources for many wildlife species
- High caloric abundant food source in a season when food can be hard to find
- Geographic overlap of the two species, wild pigs and pecans
- Foraging behavior leads to damage of pecan operations as well as loss in yields as a result

Objectives:

- Determine resource selection by wild pigs in and around pecan orchards and groves in response to timing of pecan harvest
- Quantify loss of pecan yields due to wild pig damage

Study Area

- Noble Research Institute's Red River Farm in southern Love County, Oklahoma
- Approximately 3200-acre pasture and demonstration farm including 365 acres of harvested pecans
- Abundant wild pig population

Methods:

Recourse Selection

- BoarBuster™ traps
- Captured, collared and released 29 individual adult sows over 2 seasons (n=16 in 2016, n=13 in 2017)
- Target was 2 individuals per sounder
- Vectronic Vertex Lite GPS collars with Iridium communication.
- Programmed to take 1 GPS location every 30 min

The Process

The Process

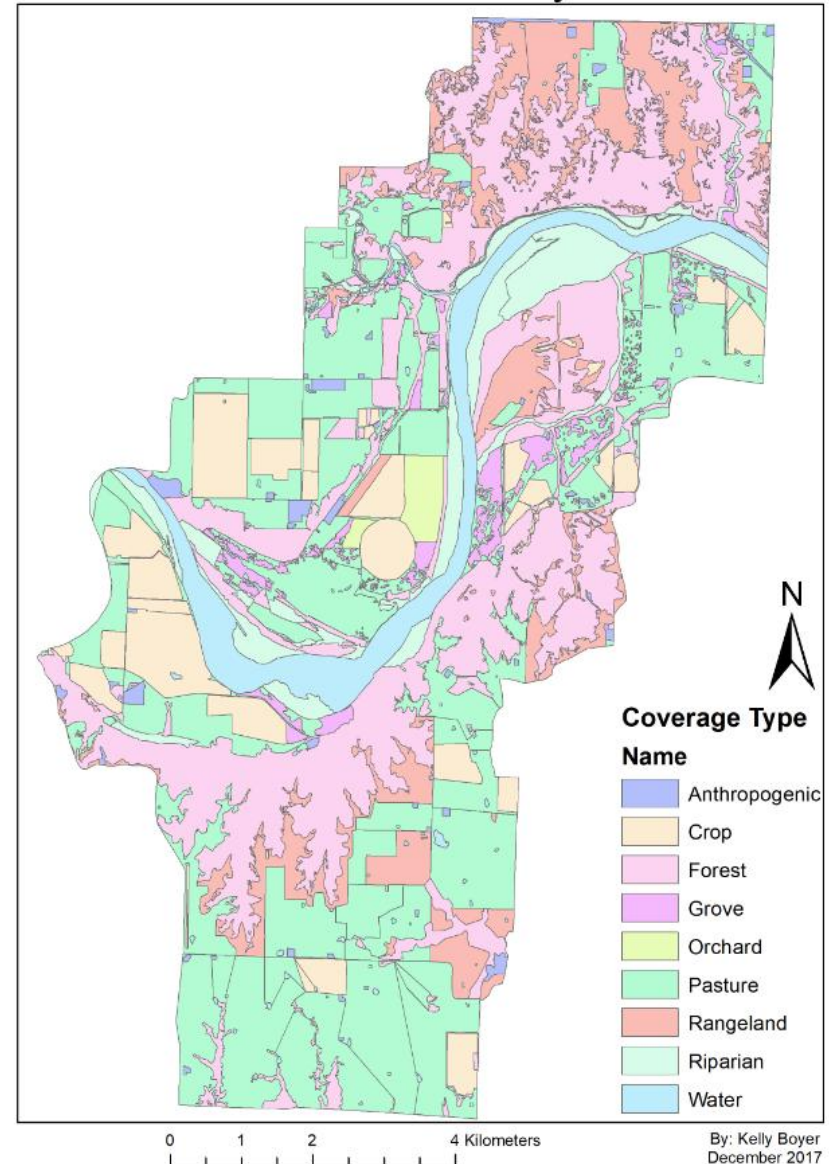

The Process

Methods: Resource Selection

- High resolution imagery was heads-up digitized to represent 8 coverage classifications within the study area
- Resource selection analysis using generalized linear mixed modeling

Classification of Study Extent

Depredation – Pecan Loss

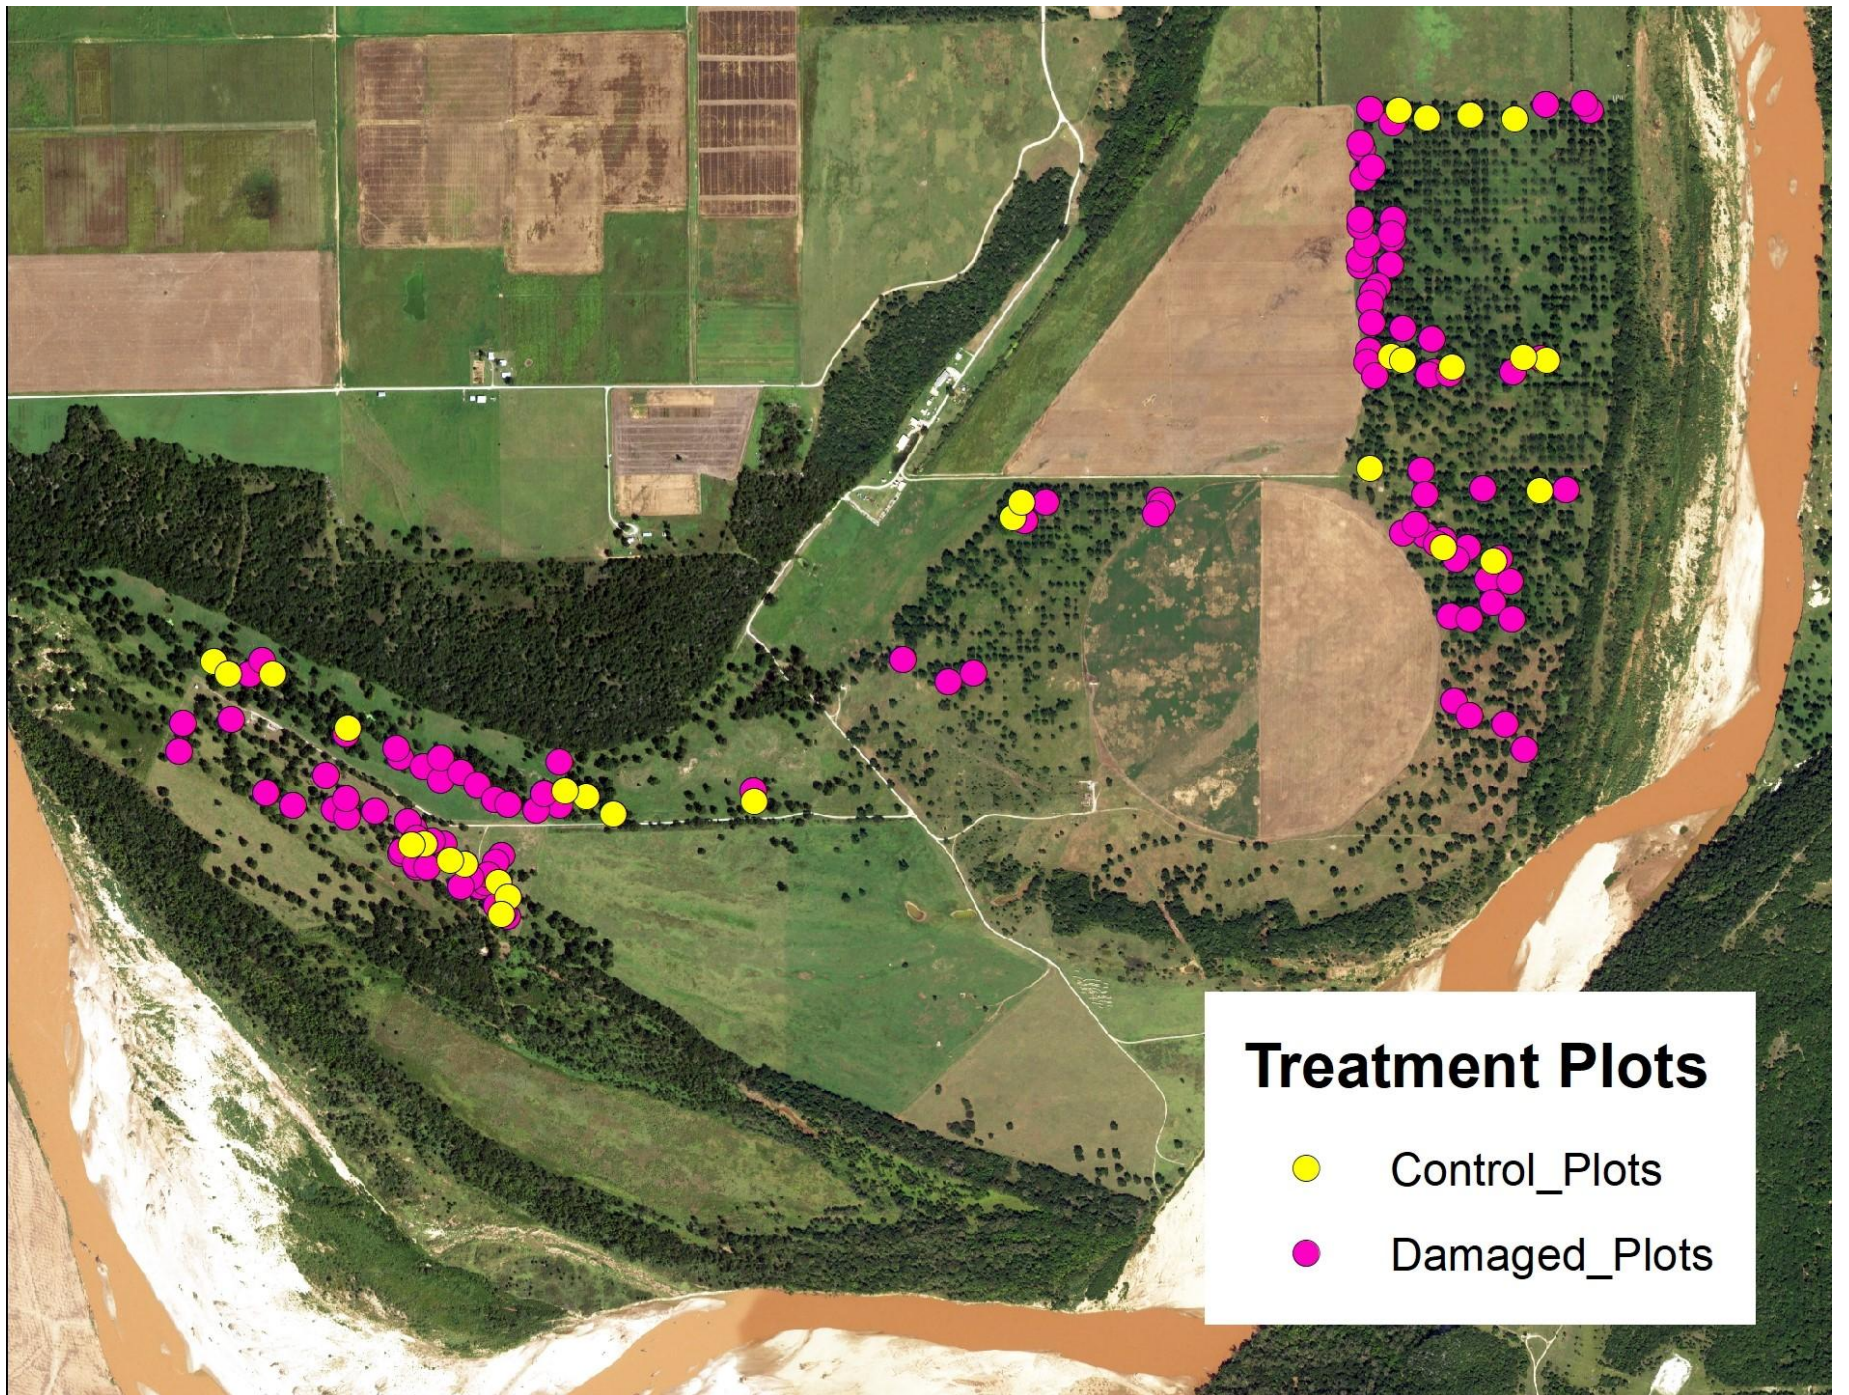

Depredation – Pecan Loss

Methods: loss of pecan

- Identified and measured areas of damage caused by wild pigs in pecan orchards and groves
- Sampled 0.33m² plots at random within damaged areas; recorded damage depth and number of pecans both pre and post-harvest
- Identical sampling in control areas with no damage caused by wild pigs

Results:

Pecan loss

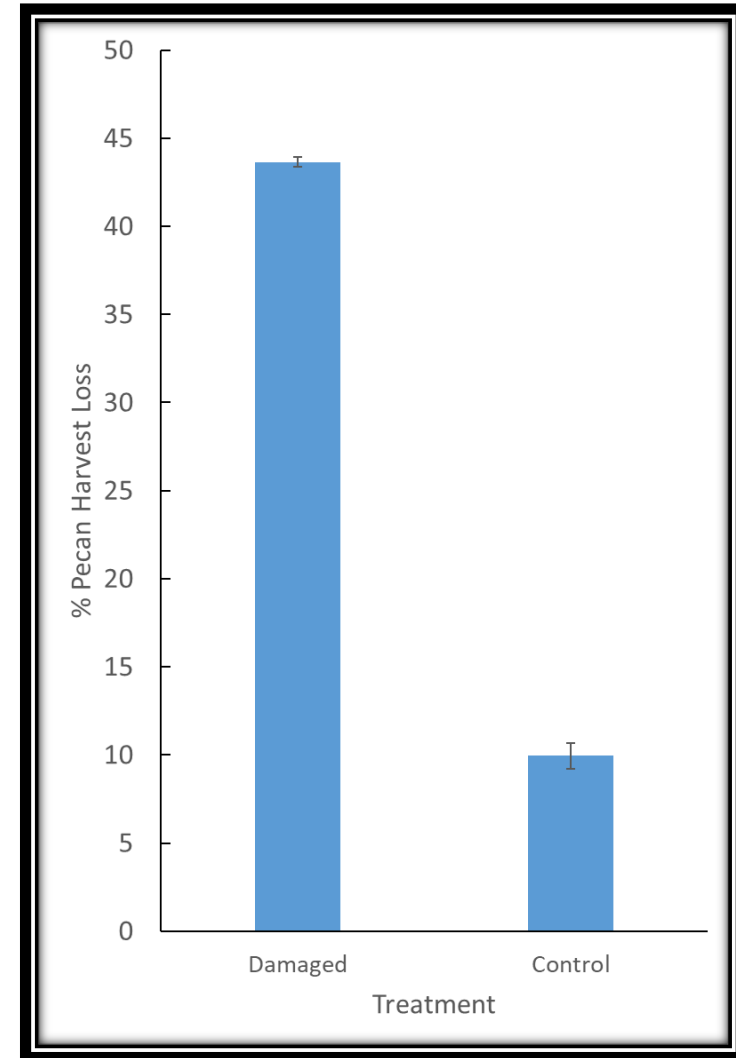

- We found that the treatment Damaged vs Control was the only significant predictor ($F_{1, 133} = 5.21$, $P = 0.024$) of harvest inefficiency

Treatment	F Value	PR>F
Orchard VS Grove (Damage)	0.05	0.8268
Orchard VS Grove (Control)	0.02	0.8823
Damaged VS Control	5.21	0.0241
Damage Depth	0.05	0.8281

Results:

Pecan loss

- Pecan harvest loss for damaged areas (n=111) was **43.65%**
- Pecan harvest loss for control areas (n= 30) was **9.96%**
- Net loss of **33.7%** as the result of rooting damage

Results:

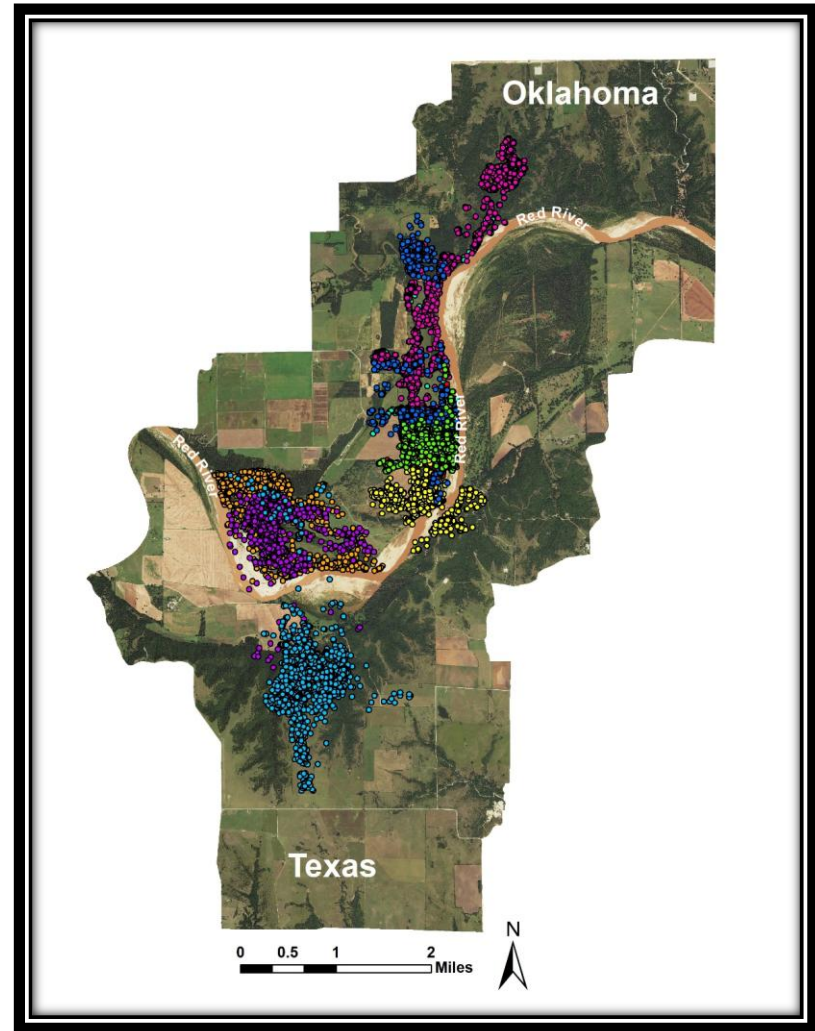

%Damage x % Loss x Operation Size x Production x Price = Loss in \$\$\$

	% Damage	% Loss	Acres of Operation	Production	Price per Pound	Dollar Loss
Native	40	33.7	50	430	\$ 1.60	\$ 4,637.12
Improved	30	33.7	150	650	\$ 2.25	\$ 22,178.81
Total Loss to Hog Damage						\$26,815.93

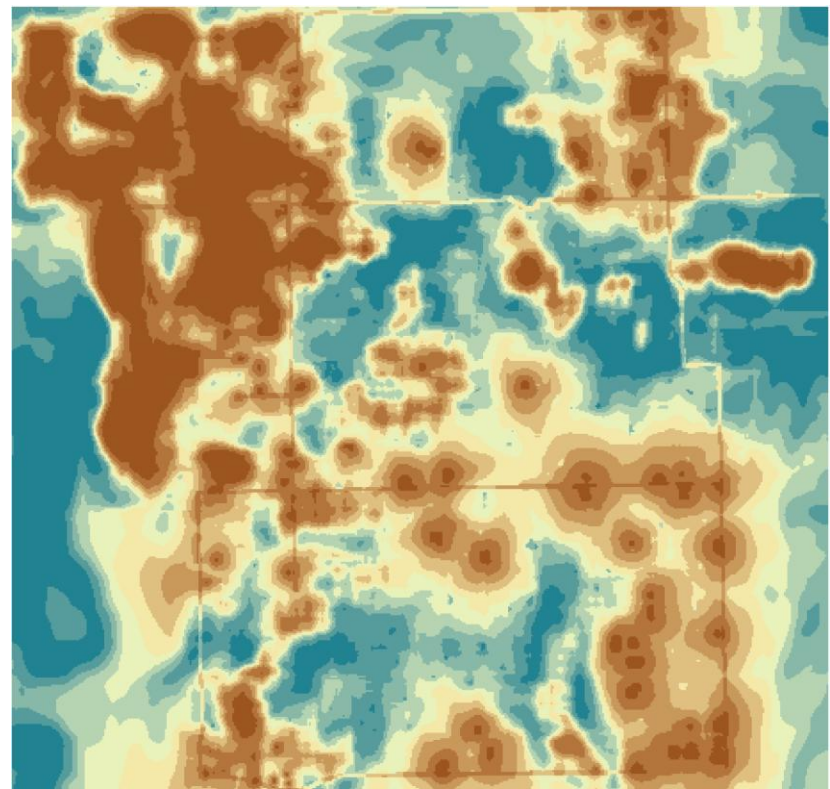

Results:

Resource Selection

- Study period in 2016 was 76 days (October 10 – December 29) and in 2017, 69 days (October 13 – December 20)
- 98.9% fix rate success over 2 year study
- 28:29 collars were collected from individuals using GPS and VHF telemetry

Spatial Prediction – Pig Use

Disease

- **Brucella spp.**
- **Pseudorabies virus**
- **Tularemia**
- **Porcine reproductive and respiratory syndrome**
- **Chagas disease**
- **Canine neosporosis**

Disease

- **Brucella spp. = 15.5%**
- **Pseudorabies virus = 34.0%**
- **Tularemia = 19.9%**
- **Porcine reproductive and respiratory syndrome = 0.26%**
- **Chagas disease = 0.0%**
- **Canine neosporosis = 67.2%**

Disease – Wildlife Services

Prevalence (%)

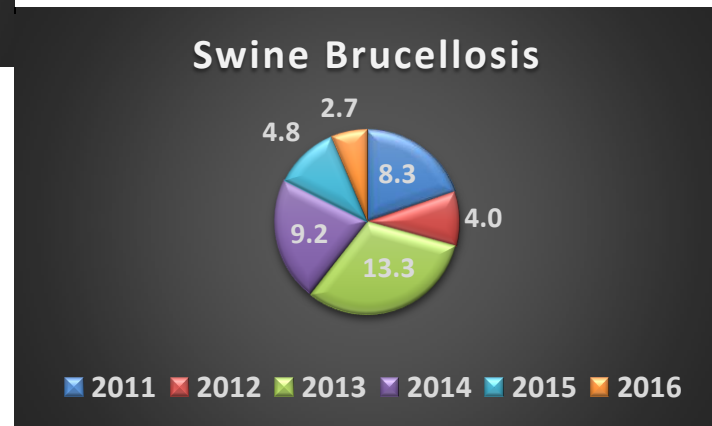

Classical swine fever (0%)
 Pseudorabies (24.4%)
 Swine brucellosis (7.1%)
 Influenza A virus (7.2%)
 Leptospirosis (46.2%)
 Toxoplasmosis (8.5%)
 Trichinosis (1.0%)
 Tuberculosis (0%)
 Foot and mouth disease (0%)
 Hepatitis E (10.9%)
 African swine fever (0%)
 Salmonella (63.6%)
 Porcine reproductive and respiratory syndrome (0.9%)
 Bluetongue virus (27.0%)
 Senecavirus (0%)

--2011-2016

--28,253 pigs removed

--5,825 tested

Conclusion & Discussion

- Net loss of pecans was found to be 33.7%
- Consumption would be additive to over all loss
- Damage too severe to harvest

Conclusion & Discussion

- Potential for disease contamination
- Resource selection will help to mitigate and prioritize areas for control and reduce loss of pecans from wild pigs.

Miscellaneous

--Home range size (Sept.-Jan.) = **564 acres** (112-1,204)

--11 of 16 pigs cross the Red River 80 times (2-11 crossings)

--Litter size = **5.3** (2-9)

--Genetic analyses = 734 DNA samples

--Population monitoring

--Digital phenotyping (age & body mass)
